(54) Title: PROCESSES FOR THE PREPARATION OF N-HETEROARYL-N-ARYL-AMINES BY REACTING AN N-ARYL CARBAMIC ACID ESTER WITH A HALO-HETEROARYL AND ANALOGOUS PROCESSES

(57) Abstract: The present invention relates to processes for producing a diaryl amine compound of the formula (I); or a salt thereof, said process comprising the step of coupling a compound of formula (II) with an amine of formula (III) in the presence of an alkali metal salt or a transition metal catalyst, wherein: Ar₁ and Ar₂ are independently Q; wherein each Q is an aryl or heteroaryl ring system optionally fused to a saturated or unsaturated 5-8 membered ring having 0-4 heteroatoms; wherein Q is optionally substituted as defined in claim 1, wherein: X is a leaving group; and Y is -C(O)-O-Z; and Z is selected from C₁-C₆ aliphatic, benzyl, Fmoc, -SO₂R' and Q, provided that Q is not substituted with X or alkylne; wherein R' is as defined in claim 1.

WO 2004/072038 A1

PROCESSES FOR THE PREPARATION OF N-HETEROARYL-N-ARYL-AMINES BY REACTING AN
N-ARYL CARBAMIC ACID ESTER WITH A HALO-HETEROARYL AND ANALOGOUS PROCESSES

TECHNICAL FIELD OF THE INVENTION

[0001] The present invention relates to processes
5 for the facile synthesis of diaryl amines and analogues
thereof. The processes of the present invention
produce diaryl amines in high yield and purity. The
present invention also relates to intermediates useful
in the process of the present invention. The present
10 invention also relates to a diaryl amines produced by
the processes of the present invention.

BACKGROUND OF THE INVENTION

[0002] Protein kinases are involved in various
cellular responses to extracellular signals. Recently,
15 a family of mitogen-activated protein kinases (MAPK)
has been discovered. Members of this family are
Ser/Thr kinases that activate their substrates by
phosphorylation [B. Stein et al., Ann. Rep. Med. Chem.,
31, pp. 289-98 (1996)]. MAPKs are themselves activated
20 by a variety of signals including growth factors,
cytokines, UV radiation, and stress-inducing agents.

- 2 -

[0003] One particularly interesting MAPK is p38. p38, also known as cytokine suppressive anti-inflammatory drug binding protein (CSBP) and RK, was isolated from murine pre-B cells that were transfected with the lipopolysaccharide (LPS) receptor, CD14, and induced with LPS. p38 has since been isolated and sequenced, as has the cDNA encoding it in humans and mice. Activation of p38 has been observed in cells stimulated by stress, such as treatment of lipopolysaccharides (LPS), UV, anisomycin, or osmotic shock, and by cytokines, such as IL-1 and TNF.

[0004] Inhibition of p38 kinase leads to a blockade on the production of both IL-1 and TNF. IL-1 and TNF stimulate the production of other proinflammatory cytokines such as IL-6 and IL-8 and have been implicated in acute and chronic inflammatory diseases and in post-menopausal osteoporosis [R. B. Kimble et al., Endocrinol., 136, pp. 3054-61 (1995)].

[0005] Based upon this finding, it is believed that p38, along with other MAPKs, have a role in mediating cellular response to inflammatory stimuli, such as leukocyte accumulation, macrophage/monocyte activation, tissue resorption, fever, acute phase responses and neutrophilia. In addition, MAPKs, such as p38, have been implicated in cancer, thrombin-induced platelet aggregation, immunodeficiency disorders, autoimmune disease, cell death, allergies, osteoporosis and neurodegenerative diseases. Inhibitors of p38 have also been implicated in the area of pain management through inhibition of prostaglandin endoperoxide synthase-2 induction. Other disease associated with IL-1, IL-6, IL-8 or TNF overproduction are set forth in WO 96/21654.

- 3 -

[0006] Many molecules possessing medicinally important properties against various targets, including MAPKs, comprise diaryl amines. One example of this is a class of molecules identified as potent p38 MAP kinase inhibitors (see, e.g., WO 99/58502 and WO 00/17175). However, although they are effective as drugs, there are few ways to make aryl amine-containing molecules without a significant amount of by-product. Palladium-catalyzed couplings of an aryl amine and aryl halide have been the traditional strategy to produce a molecule comprising a diaryl amine. However, problems with over-addition of the aryl halide partner to the amine have traditionally resulted in low yields and purities when a primary aryl amine is employed. For this reason, primary amines are not commonly employed substrates for this transformation, which has limited the scope of the palladium-catalyzed coupling reaction.

[0007] Accordingly, the need exists for a process for the facile synthesis of diaryl amines and analogues thereof that avoids the problem of over-arylation, to obtain diaryl amines in high yield and purity. There also exists a need for intermediates produced by such a process.

SUMMARY OF THE INVENTION

[0008] According to one embodiment, the present invention provides processes for the facile synthesis of diaryl amines that avoid the problem of over-arylation, are amenable to large scale preparation, and provide high yields. The present invention also avoids the use of harmful reagents such as tin compounds. Specifically, the present invention provides a process wherein a primary aryl amine is rendered temporarily

- 4 -

"secondary" by adding a suitable protecting group to the nitrogen. Once formed, this protected aniline derivative undergoes an alkali metal salt-promoted or transition metal-catalyzed cross coupling with an aryl
5 leaving group to produce an intermediate, which, upon deprotection, produces the diaryl amine substrate. The product may be produced with few by-products and in high yield.

[0009] The invention provides processes for
10 producing a compound of the formula (I):

(I)

or a salt thereof,
wherein:

15 Ar_1 and Ar_2 are as defined below.

[0010] The processes of this invention comprise the step of coupling a compound of formula (II) with an amine of formula (III) to obtain a diaryl amine of formula (I), in the presence of an alkali metal salt or
20 transition metal catalyst:

(II)

(III)

wherein:

Ar_1 , Ar_2 , X, and Y are as defined below.

25 **[0011]** The processes of this invention have the advantages of allowing preparation of a compound of formula (I) from a primary aryl amine derivative without the problem of over-arylation. The processes of this invention have the further advantage of
30 allowing preparation of a compound of formula (I) in high yield and purity, in addition to facile reaction

- 5 -

conditions that are readily scaled up for large scale preparation.DETAILED DESCRIPTION OF THE INVENTION

[0012] The present invention overcomes the difficulties and shortcomings of the prior art and provides processes for producing a compound of the formula (I):

or a salt thereof,

wherein:

Ar₁ and Ar₂ are independently Q;

wherein each Q is an aryl or heteroaryl ring system optionally fused to a saturated or unsaturated 5-8 membered ring having 0-4 heteroatoms;

wherein Q is optionally substituted at one or more ring atoms with one or more substituents independently selected from halo; C₁-C₆ aliphatic optionally substituted with N(R')₂, OR', CO₂R', C(O)N(R')₂, OC(O)N(R')₂, NR'CO₂R', NR'C(O)R', SO₂N(R')₂, N=CH-N(R')₂, or OPO₃H₂; C₁-C₆ alkoxy optionally substituted with N(R')₂, OR', CO₂R', C(O)N(R')₂, OC(O)N(R')₂, SO₂N(R')₂, NR'CO₂R', NR'C(O)R', N=CH-N(R')₂, or OPO₃H₂; Ar₃; CF₃; OCF₃; OR'; SR'; SO₂N(R')₂; OSO₂R'; SCF₃; NO₂; CN; N(R')₂; CO₂R'; CO₂N(R')₂; C(O)N(R')₂; NR'C(O)R'; NR'CO₂R'; NR'C(O)C(O)R'; NR'SO₂R'; OC(O)R'; NR'C(O)R²; NR'CO₂R²; NR'C(O)C(O)R²; NR'C(O)N(R')₂; OC(O)N(R')₂; NR'SO₂R²; NR'R²; N(R²)₂; OC(O)R²; OPO₃H₂; and N=CH-N(R')₂;

- 6 -

R' is selected from hydrogen; C₁-C₆ aliphatic; or a 5-6 membered carbocyclic or heterocyclic ring system optionally substituted with 1 to 3 substituents independently selected from halo, C₁-C₆ alkoxy, cyano, nitro, amino, hydroxy, and C₁-C₆ aliphatic;

R² is a C₁-C₆ aliphatic optionally substituted with N(R')₂, OR', CO₂R', C(O)N(R')₂ or SO₂N(R')₂; or a carbocyclic or heterocyclic ring system optionally substituted with N(R')₂, OR', CO₂R', C(O)N(R')₂ or SO₂N(R')₂;

wherein Ar₃ is an aryl or heteroaryl ring system optionally fused to a saturated or unsaturated 5-8 membered ring having 0-4 heteroatoms;

wherein Ar₃ is optionally substituted at one or more ring atoms with one or more substituents independently selected from halo; C₁-C₆ aliphatic optionally substituted with N(R')₂, OR', CO₂R', C(O)N(R')₂, OC(O)N(R')₂, NR'CO₂R', NR'C(O)R', SO₂N(R')₂, N=CH-N(R')₂, or OPO₃H₂; C₁-C₆ alkoxy optionally substituted with N(R')₂, OR', CO₂R', C(O)N(R')₂, OC(O)N(R')₂, SO₂N(R')₂, NR'CO₂R', NR'C(O)R', N=CH-N(R')₂, or OPO₃H₂; CF₃; OCF₃; OR'; SR'; SO₂N(R')₂; OSO₂R'; SCF₃; NO₂; CN; N(R')₂; CO₂R'; CO₂N(R')₂; C(O)N(R')₂; NR'C(O)R'; NR'CO₂R'; NR'C(O)C(O)R'; NR'SO₂R'; OC(O)R'; NR'C(O)R²; NR'CO₂R²; NR'C(O)C(O)R²; NR'C(O)N(R')₂; OC(O)N(R')₂; NR'SO₂R²; NR'R²; N(R²)₂; OC(O)R²; OPO₃H₂; and N=CH-N(R')₂.

[0013] In a preferred embodiment, Ar₁ and Ar₂ are independently selected from optionally substituted

- 7 -

phenyl, naphthyl, benzimidazolyl, benzothienyl,
benzofuranyl, indolyl, quinolinyl, benzothiazolyl,
benzooxazolyl, benzimidazolyl, isoquinolinyl,
isoindolyl, acridinyl, benzoisoxazolyl, pyridyl,
5 pyrimidyl, pyridazinyl, tetrazolyl, furanyl,
imidizaolyl, isoxazolyl, oxadiazolyl, oxazolyl,
pyrrolyl, thiazolyl, triazolyl, and thienyl. In a more
preferred embodiment, Ar₁ and Ar₂ are independently
selected from optionally substituted phenyl and
10 pyridyl. In an even more preferred embodiment, Ar₁ is
optionally substituted pyridyl and Ar₂ is optionally
substituted phenyl.

[0014] The processes of this invention comprise the
step of coupling a compound of formula (II) with an
15 amine of formula (III) to obtain a diaryl amine of
formula (I), in the presence of an alkali metal salt or
transition metal catalyst:

20 wherein:

X is a leaving group; and

Y is -C(O)-O-Z; and

Z is selected from C₁-C₆ aliphatic, benzyl,
Fmoc, -SO₂R' and Q, provided that Q is not substituted
25 with X or alkyne; wherein Ar₁, Ar₂, Q and R' are as
defined above.

[0015] Scheme 1 below depicts a preferred process of
the present invention:

- 8 -

Scheme 1

wherein Ar₁, Ar₂, X, and Y are as defined above. The steps illustrated above may be described as follows:

Step 1:

5 **[0016]** A compound of formula (II), bearing a suitable leaving group X, is reacted with a compound of formula (III), which bears the Y-NH-moiety. The reaction is conducted in the presence of an alkali metal salt, such as cesium carbonate; or alternatively
 10 a transition metal catalyst, and optionally a base and optionally one or more ligands.

[0017] In one embodiment, a transition metal catalyst is used. An exemplary transition metal catalyst that can be used comprises a transition metal
 15 ion or atom and one or more suitable ligands. Preferably, the transition metal catalyst comprises a Group 8 metal. More preferably, the transition metal

- 9 -

catalyst comprises palladium. According to a preferred embodiment, two different ligands are simultaneously used in step 1.

5 **[0018]** According to a preferred embodiment, a base is used in step 1 in conjunction with the transition metal catalyst. Suitable bases include K_{OT}Bu, Na_{OT}Bu, K₃PO₄, Na₂CO₃, and Cs₂CO₃. More preferably, the base is K₃PO₄.

10 **[0019]** Preferred solvents for step 1 when using a transition metal catalyst include toluene and non-polar aprotic solvents such as MTBE, DME, and hexane.

[0020] In another embodiment, an alkali metal salt is used in step 1. Preferably, the alkali metal salt is a cesium salt.

15 **[0021]** Preferred solvents for step 1 when using an alkali metal salt include polar aprotic solvents such as NMP.

Step 2:

20 **[0022]** In step 2, radical Y of (IV) is removed to produce the diaryl amine of formula (I).

[0023] According to a preferred embodiment, an acid, such as TFA, HCl, HBr, or HI is used in step 2. More preferably, the acid is TFA.

25 **[0024]** Preferred solvents for step 2 include chlorinated solvents such as CH₂Cl₂, 1,2-dichloroethane, and chlorobenzene.

[0025] The processes of this invention have the advantages of allowing preparation of a compound of formula (I) from a primary aryl amine derivative without the problem of over-arylation. The processes of this invention have the further advantage of

30

- 10 -

allowing preparation of a compound of formula (I) in high yield and purity, and on a large scale.

Step 1 Reagents:

5 **[0026]** Transition metal catalysts suitable for the present invention comprise a transition metal atom or ion and one or more ligands. The transition metal may exist in any suitable oxidation state ranging from zero valence to any higher valence available to the
10 transition metal. According to a preferred embodiment, the transition metal catalyst comprises a Group 8 metal. More preferably, the transition metal catalyst comprises palladium. Catalyst complexes may include chelating ligands, including, without limitation, alkyl
15 and aryl derivatives of phosphines and biphosphines, imines, arsines, and hybrids thereof.

[0027] More preferably, the transition metal catalyst is a palladium catalyst of the formula PdL_n , wherein each L is independently selected from Cl, -OAc,
20 -O-tolyl, halogen, PPh_3 , dppe, dppf, and BINAP; and n is an integer from 1-4. The aforementioned transition metal catalysts may be prepared using methods known in the art.

[0028] A variety of ligand transformations may occur
25 throughout the process of the present invention. The ligand may be bound to the transition metal throughout the process of the present invention, or the ligand may be in a labile configuration in relation to the transition metal during all or part of the process.
30 Accordingly, the term "transition metal catalyst" as used herein includes any transition metal catalyst and/or catalyst precursor as it is introduced into the reaction vessel and which is, if necessary, converted

- 11 -

in situ into the active form of catalyst that participates in the reaction.

[0029] The quantity of the transition metal catalyst to be used in the present process is any quantity that promotes the formation of the diaryl amine product. According to a preferred embodiment, the quantity is a catalytic amount, wherein the catalyst is used in an amount that is less than stoichiometric relative to the aryl components. In another preferred embodiment, the catalyst is present in the range of about 0.01 to about 20 mole percent relative to the non-amine aryl component, more preferably about 1 to about 10 mole percent, and even more preferably about 1 to about 5 mole percent.

[0030] One of skill in the art may readily select an appropriate solvent to use in the process of the present invention. A solvent may be present in any quantity need to facilitate the desired process, and does not necessarily have to be a quantity to dissolve the substrates and/or reagents of the desired process. A solvent according to the present invention will not interfere with the formation of the diaryl amine product. Examples of suitable solvents include, without limitation, halogenated solvents, hydrocarbon solvents, ether solvents, protic solvents, and aprotic solvents. Mixtures of solvents are also included within the scope of this invention. Preferred solvents useful for Step 1 of the process of the present invention using a transition metal catalyst include toluene, benzene, or a non-polar aprotic solvent such as MTBE, DME, or hexane.

[0031] According to one embodiment, the coupling step using a transition metal catalyst (Step 1) occurs

- 12 -

in the presence of a base. Examples of suitable bases include, without limitation, alkali metal hydroxides, alkali metal alkoxides, metal carbonates, phosphates, alkali metal aryl oxides, alkali metal amides, tertiary
5 amines, (hydrocarbyl)ammonium hydroxides, and diaza organic bases. The quantity of base used may be any quantity which allows for the formation of the diaryl amine product. Preferred bases of the present invention include KOtBu, NaOtBu, K_3PO_4 , Na_2CO_3 , and
10 Cs_2CO_3 .

[0032] Alkali metal salts suitable for the present invention comprise salts of sodium, potassium, rubidium or cesium ions. Preferably, alkali metal salts suitable for the present invention comprise salts of
15 potassium or cesium ions. Preferred alkali metal salts comprise carbonate, phosphate, and alkoxide salts. More preferred alkali metal salts suitable include potassium carbonate and cesium carbonate. Most preferably, the alkali metal salt is cesium carbonate.

20 **[0033]** The quantity of the transition metal catalyst to be used in the present process is any quantity that promotes the formation of the diaryl amine product.

[0034] Preferred solvents useful for Step 1 of the process of the present invention using an alkali metal
25 salt include polar aprotic solvents such as NMP.

Step 2 Reagents:

[0035] According to a preferred embodiment, the protecting group removal step (Step 2) occurs in the
30 presence of an acid. Examples of suitable acids include, without limitation, HCl, HBr, HI, and organic acids including formic acid, acetic acid, propionic acid, butanoic acid, methanesulfonic acid, p-toluene

- 13 -

sulfonic acid, benzenesulfonic acid, and trifluoroacetic acid. Preferred acids of the present invention include HCl, HBr, HI, and TFA.

5 **[0036]** Preferred solvents for Step 2 of the process of the present invention include chlorinated solvents such as CH₂Cl₂, 1,2-dichloroethane, and chlorobenzene.

10 **[0037]** In one embodiment of the present invention, X is a leaving group. According to a preferred embodiment, X is selected from the group consisting of Cl, Br, I, F, OTf, OTs, iodonium, and diazo.

[0038] In one embodiment of the present invention, Y is a carbamate amine protecting group. According to a preferred embodiment, Y is Boc.

15 **[0039]** As used herein, the following definitions shall apply unless otherwise indicated. Also, combinations of substituents are permissible only if such combinations result in stable compounds.

20 **[0040]** Some of the abbreviations used throughout the specification (including the chemical formulae) are:

Boc = t-butoxycarbonyl

Fmoc = fluorenylmethoxycarbonyl

Tf = trifluoromethanesulfonate

Ts = p-toluenesulfonyl

25 Ms = methanesulfonyl

TFA = trifluoroacetic acid

Ac = acetyl

dba = trans,trans-dibenzylideneacetone

dppe = 1,2-bis-(diphenylphosphino)ethane

30 dppf = 1,1'-bis-(diphenylphosphanyl)ferrocene

dppp = propane-1,3-diylbis(diphenylphosphane)

BINAP = 2,2'-bis(diphenylphosphanyl)-1,1'-binaphthyl

MTBE = methyl t-butyl ether

- 14 -

DME = dimethoxyethane
CDI = 1,1'-carbonyl-diimidazole
DCC = N,N'-dicyclohexylcarbodiimide
EDC = 1-ethyl-3-(3-dimethylaminopropyl)
5 carbodiimide hydrochloride
HOBT = N-hydroxybenzotriazole
NMP = N-methylpyrrolidinone
DMF = dimethylformamide
MCPBA = m-chloroperbenzoic acid
10 MMPP = magnesium monoperoxyphthalate hexahydrate
DIBAL-H = diisobutyl aluminum hydride
LAH = lithium aluminum hydride
super hydride = lithium triethylborohydride
L-selectride = lithium tri-sec-butylborohydride
15 Red-Al = sodium bis(methoxyethoxy)aluminum hydride
IPA = isopropanol
glyme = dimethoxy ethane
diglyme = bis(2-methoxy ethyl)ether

[0041] As used herein, the following definitions
20 shall apply unless otherwise indicated. The phrase
"optionally substituted" is used interchangeably with
the phrase "substituted or unsubstituted." Also,
combinations of substituents are permissible only if
such combinations result in chemically stable
25 compounds. In addition, unless otherwise indicated,
functional group radicals are independently selected.

[0042] The term "leaving group", as used herein, has
the definition known to those of ordinary skill in the
art (see, March, Advanced Organic Chemistry, 4th
30 Edition, John Wiley & Sons, pp. 352-357, 1992, herein
incorporated by reference). Examples of leaving groups
include, without limitation, halogens such as F, Cl,
Br, and I, diazo, aryl- and alkyl-sulfonyloxy groups,
and trifluoromethanesulfonyloxy.

- 15 -

[0043] The term "aliphatic" as used herein means straight-chain or branched C₁-C₁₂ hydrocarbon chain that is completely saturated or that contains one or more units of unsaturation. The term "aliphatic" also includes a monocyclic C₃-C₈ hydrocarbon or bicyclic C₈-C₁₂ hydrocarbon that is completely saturated or that contains one or more units of unsaturation, but which is not aromatic (said cyclic hydrocarbon chains are also referred to herein as "carbocycle" or "cycloalkyl"), that has a single point of attachment to the rest of the molecule wherein any individual ring in said bicyclic ring system has 3-7 members. For example, suitable aliphatic groups include, but are not limited to, linear or branched alkyl, alkenyl, alkynyl groups and hybrids thereof such as (cycloalkyl)alkyl, (cycloalkenyl)alkyl or (cycloalkyl)alkenyl.

[0044] The terms "alkyl", "alkoxy", "hydroxyalkyl", "alkoxyalkyl", and "alkoxycarbonyl", used alone or as part of a larger moiety includes both straight and branched chains containing one to twelve carbon atoms. The terms "alkenyl" and "alkynyl" used alone or as part of a larger moiety shall include both straight and branched chains containing two to twelve carbon atoms, wherein an alkenyl comprises at least one double bond and an alkynyl comprises at least one triple bond.

[0045] The term "chemically stable" or "chemically feasible and stable", as used herein, refers to a compound structure that renders the compound sufficiently stable to allow manufacture and administration to a mammal by methods known in the art. Typically, such compounds are stable at temperature of 40°C or less, in the absence of moisture or other chemically reactive conditions, for at least a week.

- 16 -

[0046] The term "haloalkyl", "haloalkenyl", and "haloalkoxy", means alkyl, alkenyl, or alkoxy, as the case may be, substituted with one or more halogen atoms. The term "halogen" means F, Cl, Br, or I.

5 **[0047]** The term "heteroatom" means N, O, or S and shall include any oxidized form of nitrogen and sulfur, and the quaternized form of any basic nitrogen.

[0048] The term "amine" or "amino" used alone or as part of a larger moiety, refers to a trivalent
10 nitrogen, which may be primary or which may be substituted with 1-2 aliphatic groups.

[0049] The term "aryl" used alone or as part of a larger moiety as in "aralkyl", "aralkoxy", or "aryloxyalkyl", refers to monocyclic, bicyclic, and
15 tricyclic carbocyclic ring systems having a total of five to fourteen members, where at least one ring in the system is aromatic and wherein each ring in the system contains 3 to 8 ring members. The term "aryl" may be used interchangeably with the term "aryl ring".

20 **[0050]** The term "heterocycle", "heterocyclyl", or "heterocyclic" as used herein means non-aromatic, monocyclic, bicyclic, or tricyclic ring systems having five to fourteen ring members in which one or more of the ring members is a heteroatom, wherein each ring in
25 the system contains 3 to 7 ring members.

[0051] One having ordinary skill in the art will recognize that the maximum number of heteroatoms in a stable, chemically feasible heterocyclic or heteroaromatic ring is determined by the size of the
30 ring, degree of unsaturation, and valence of the heteroatoms. In general, a heterocyclic or heteroaromatic ring may have one to four heteroatoms so

- 17 -

long as the heterocyclic or heteroaromatic ring is chemically feasible and stable.

[0052] The term "heteroaryl", used alone or as part of a larger moiety as in "heteroaralkyl" or

5 "heteroarylalkoxy", refers to monocyclic, bicyclic and tricyclic ring systems having a total of five to fourteen ring members, and wherein at least one ring in the system is aromatic, at least one ring in the system contains one or more heteroatoms, and each ring in the
10 system contains 3 to 7 ring members. The term "heteroaryl" may be used interchangeably with the term "heteroaryl ring" or the term "heteroaromatic".

[0053] An aryl (including aralkyl, aralkoxy, aryloxyalkyl and the like) or heteroaryl (including
15 heteroarylalkyl and heteroarylalkoxy and the like) group may contain one or more substituents. Suitable substituents on the unsaturated carbon atom of an aryl, heteroaryl, aralkyl, or heteroaralkyl group are

selected from halogen; haloalkyl; $-\text{CF}_3$; $-\text{R}^4$; $-\text{OR}^4$; $-\text{SR}^4$;
20 1,2-methylenedioxy; 1,2-ethylenedioxy; protected OH (such as acyloxy); phenyl (Ph); Ph substituted with R^4 ; $-\text{OPh}$; $-\text{OPh}$ substituted with R^4 ; $-\text{CH}_2\text{Ph}$; $-\text{CH}_2\text{Ph}$ substituted with R^4 ; $-\text{CH}_2\text{CH}_2(\text{Ph})$; $-\text{CH}_2\text{CH}_2(\text{Ph})$ substituted with R^4 ; $-\text{NO}_2$; CN ; $\text{N}(\text{R}^4)_2$; $-\text{NR}^4\text{C}(\text{O})\text{R}^4$; $-\text{NR}^4\text{C}(\text{O})\text{N}(\text{R}^4)_2$;
25 $-\text{NR}^4\text{CO}_2\text{R}^4$; $-\text{NR}^4\text{NRC}(\text{O})\text{R}^4$; $-\text{NR}^4\text{C}(\text{O})\text{N}(\text{R}^4)_2$; $-\text{NR}^4\text{NR}^4\text{C}(\text{O})\text{R}^4$;

- 18 -

hydrogen, optionally substituted C₁₋₆ aliphatic, an unsubstituted 5-6 membered heteroaryl or heterocyclic ring, phenyl (Ph), -O-Ph, -CH₂(Ph); wherein y is 0-6; and V is a linker group. When R⁴ is C₁₋₆ aliphatic, it
5 may be substituted with one or more substituents selected from -NH₂, -NH(C₁₋₄ aliphatic), -N(C₁₋₄ aliphatic)₂, -S(O)(C₁₋₄ aliphatic), -SO₂(C₁₋₄ aliphatic), halogen, -(C₁₋₄ aliphatic), -OH, -O-(C₁₋₄ aliphatic), -NO₂, -CN, -CO₂H, -CO₂(C₁₋₄ aliphatic), -O-(halo C₁₋₄
10 aliphatic), or -halo(C₁₋₄ aliphatic); wherein each C₁₋₄ aliphatic is unsubstituted.

[0054] The term "linker group" or "linker" means an organic moiety that connects two parts of a compound. Linkers are comprised of -O-, -S-, -NR*- , -C(R*)₂-,
15 -C(O)-, or an alkylidene chain. The alkylidene chain is a saturated or unsaturated, straight or branched, C₁₋₆ carbon chain which is optionally substituted, and wherein up to two non-adjacent saturated carbons of the chain are optionally replaced by -C(O)-, -C(O)C(O)-,
20 -C(O)NR*- , -C(O)NR*NR*- , NR*NR*- , -NR*C(O)-, -S-, -SO-, -SO₂-, -NR*- , -SO₂NR*- , or -NR*SO₂-; wherein R* is selected from hydrogen or aliphatic. Optional substituents on the alkylidene chain are as described below for an aliphatic group.

25 **[0055]** An aliphatic group or a non-aromatic heterocyclic ring may contain one or more substituents. Suitable substituents on the saturated carbon of an aliphatic group or of a non-aromatic heterocyclic ring are selected from those listed above for the
30 unsaturated carbon of an aryl or heteroaryl group and the following: =O, =S, =NNHR⁵, =NN(R⁵)₂, =NR⁵, -OR⁵, =NNHC(O)R⁵, =NNHCO₂R⁵, =NNHSO₂R⁵, or =NR⁵, where each R⁵ is independently selected from hydrogen or a optionally

- 19 -

substituted C₁₋₆ aliphatic. When R⁵ is C₁₋₆ aliphatic, it may be substituted with one or more substituents selected from -NH₂, -NH(C₁₋₄ aliphatic), -N(C₁₋₄ aliphatic)₂, halogen, -OH, -O-(C₁₋₄ aliphatic), -NO₂,
5 -CN, -CO₂H, -CO₂(C₁₋₄ aliphatic), -O-(halo C₁₋₄ aliphatic), or (halo C₁₋₄ aliphatic); wherein each C₁₋₄ aliphatic is unsubstituted.

[0056] Substituents on the nitrogen of a non-aromatic heterocyclic ring are selected from -R⁶,
10 -N(R⁶)₂, -C(O)R⁶, -CO₂R⁶, -C(O)C(O)R⁶, -C(O)CH₂C(O)R⁶, -SO₂R⁶, -SO₂N(R⁶)₂, -C(=S)N(R⁶)₂, -C(=NH)-N(R⁶)₂, or -NRSO₂R; wherein each R⁶ is independently selected from hydrogen, an optionally substituted C₁₋₆ aliphatic, optionally substituted phenyl (Ph), optionally
15 substituted -O-Ph, optionally substituted -CH₂(Ph), or an unsubstituted 5-6 membered heteroaryl or heterocyclic ring. When R⁶ is a C₁₋₆ aliphatic group or a phenyl ring, it may be substituted with one or more substituents selected from -NH₂, -NH(C₁₋₄ aliphatic),
20 -N(C₁₋₄ aliphatic)₂, halogen, -(C₁₋₄ aliphatic), -OH, -O-(C₁₋₄ aliphatic), -NO₂, -CN, -CO₂H, -CO₂(C₁₋₄ aliphatic), -O-halo(C₁₋₄ aliphatic), or (halo C₁₋₄ aliphatic); wherein each C₁₋₄ aliphatic is unsubstituted.

25 **[0057]** Schemes 2-8 illustrate the application of the process of Scheme 1 to the synthesis of pyridinyl aryl amine derivatives. These pyridinyl diaryl amines synthesized according to the present invention may be further functionalized according to methods known to
30 those of skill in the art in order to produce compounds that are potent inhibitors of p38 kinase.

Scheme 2

- 21 -

wherein:

R^3 is selected from C_1 - C_6 aliphatic; aryl; and aryl substituted with C_1 - C_6 aliphatic, aryl, nitro, CN, CO_2R' , $CO_2N(R')_2$, OR' , NCO_2R' , $NR'C(O)N(R')_2$, or

5 $OC(O)N(R')_2$;

provided that R^3 is not t-butyl;

G_1 , G_2 , G_3 , G_4 , and G_5 are independently selected from hydrogen, aliphatic, aryl, substituted aryl, nitro, CN, OR' , CO_2R' , $CO_2N(R')_2$, $NR'CO_2R'$,
10 $NR'C(O)N(R')_2$, $OC(O)N(R')_2$, F, Cl, Br, I, O-Ts, O-Ms, OSO_2R' , and $OC(O)R'$;

X is a leaving group;

Y is $-C(O)-O-Z$;

Z is selected from C_1 - C_6 aliphatic, benzyl,
15 Fmoc, $-SO_2R'$ or Q, provided that Q is not substituted with X or alkyne;

wherein Q and R' are as defined above.

[0058] The various steps illustrated in Scheme 2 may be described as follows:

20 **[0059]** Step 1: The starting material **21** is available by synthesis from 2-chloronicotinic acid according to procedures known in the art (see, e.g., Scheme 3). The starting material **21** is coupled with a protected aryl amine **22** (see, e.g., Scheme 3) in the presence of an
25 alkali metal salt such as cesium carbonate in a solvent such as NMP; or alternatively in the presence of a catalyst such as palladium acetate, optionally a ligand such as BINAP or dppe, and optionally a base such as potassium phosphate in a compatible solvent such as
30 toluene, MTBE, DME, or hexane, to give the protected coupling product of formula **23**.

- 22 -

[0060] Step 2: The protected coupling product **23** is reacted with an acid such as TFA in a suitable solvent such as methylene chloride, 1,2-dichloroethane, or chlorobenzene, to give the compound of formula **24**.

- 5 **[0061]** Scheme 3a illustrates the synthesis of starting material **21** and Scheme 3b exemplifies the further derivatization of deprotected coupling product **24** of Scheme 2.

Scheme 3a

- 24 -

Scheme 3b

wherein R^3 , G_1 , G_2 , G_3 , G_4 , and G_5 are as set forth in Scheme 2 above.

5

[0062] The various steps illustrated in Schemes 3a and 3b may be described as follows:

[0063] Step A: Nicotinic acid derivative **31** may be activated by reacting it with a chloroformate activating agent such as $SOCl_2$, phenylchloroformate, or p-nitrophenyl chloroformate, or a carbodiimide activating agent such as CDI, DCC, or EDC in the presence of HOBt and N-hydroxysuccinimide in a polar aprotic solvent such as CH_2Cl_2 , 1,2-dichloroethane, DMF, or NMP, and heating. An alcohol of the formula R^3OH is then added to form compound **32**.

- 25 -

[0064] Step B: Compound **32** is coupled with a boronic acid such as **33** in the presence of a catalyst such as palladium acetate, a base such as sodium carbonate, potassium carbonate, lithium carbonate, cesium carbonate, potassium t-butoxide, sodium t-butoxide, or lithium t-butoxide in a solvent such as toluene, MTBE, DME, or hexane to give **34**.

[0065] Step C: Coupled product **34** is then N-oxidized in the presence of a reagent such as MCPBA, peracetic acid, or MMPP in a chlorinated solvent such as CH₂Cl₂ or 1,2-dichloroethane to give **35**.

[0066] Step D: N-oxide **35** is activated in the presence of a reagent such as POCl₃, POBr₃, SOCl₂, SO₂Cl₂, or SOBr₂ to give **21**.

[0067] Steps 1 and 2 are as set forth in Scheme 2 above.

[0068] Step E: The free amine of **24** is derivatized to form the corresponding urea by reaction with an activated carbonyl such as X₄C(O)X₅, wherein X₄ and X₅ are each independently selected from Cl, Br, I, imidazole, O-Ph, p-nitrophenyloxy, substituted O-aryl, or a leaving group, and then reacting the carbonyl with ammonium hydroxide in a solvent such as toluene, DME, or MTBE to form **36**.

[0069] Step F: The ester functionality of **36** is reduced to the corresponding alcohol in the presence of a reducing agent such as DIBAL, LAH, super hydride, L-Selectide, LiBH₄, NaBH₃(anilide), Red-Al, or NaBH₄ in a solvent such as THF, DME, MTBE, MeOH, EtOH, IPA, t-BuOH, glyme, or diglyme to form **37**.

[0070] Step G: The alcohol of **37** may be further functionalized such as by activation with X₄C(O)X₅,

- 26 -

wherein X_4 and X_5 are as described in step E above, then reacting the carbonyl with $\text{OH}(\text{CH}_2)_2\text{NH}_2$ to form **38**.

[0071] Although the processes of schemes 4-7 are illustrated using specific reagents and starting materials, it will be appreciated by one of skill in the art that suitable analogous reactants and starting materials may be used to prepare analogous compounds.

[0072] Scheme 4 provides an example using the method of the instant invention to produce a diaryl amine.

10

Scheme 4

[0073] The various steps illustrated in Scheme 4 may be briefly described as follows:

- 27 -

[0074] Step 1: 6-chloro-2-(4-fluorophenyl)-nicotinic acid methyl ester **41** is available by synthesis from 2-chloronicotinic acid (see, e.g., Scheme 5). **41** is coupled with a protected aryl amine such as Boc-2,6-difluoroaniline **42** (see, e.g., Scheme 5) in the presence of an alkali metal salt such as cesium carbonate and a solvent such as NMP; or alternatively in the presence of a catalyst such as palladium acetate, optionally a ligand such as BINAP, and optionally a base such as potassium phosphate in a compatible solvent such as toluene to give the protected coupling product of formula **43**.

[0075] Step 2: Protected coupling product **43** is reacted with an acid such as TFA in a suitable solvent such as methylene chloride to give the compound of formula **44**.

[0076] More generally, one of skill in the art will recognize that the compound of formula **44** may be produced by the reaction of **41a** with **42a**:

20

wherein X and Y are as set forth above.

[0077] Scheme 5a illustrates the synthesis of starting material **41** and Scheme 5b illustrates the further derivatization of the deprotected coupling product **44** of Scheme 4.

25

Scheme 5a

Scheme 5b

[0078] The various steps illustrated in Schemes 5a and 5b may be briefly described as follows:

- 5 [0079] Step A: 6-Chloronicotinic acid **51** is activated by reacting with a chloroformate activating agent such as SOCl_2 , phenylchloroformate, or p-nitrophenyl chloroformate, or a carbodiimide activating agent such as CDI, DCC, or EDC in the presence of HOBt and N-hydroxysuccinimide in a polar aprotic solvent such as CH_2Cl_2 , 1,2-dichloroethane, DMF, or NMP, and heating. An alcohol such as methanol is then added to form 6-chloronicotinic acid methyl ester **52**.
- 10 [0080] Step B: Compound **52** is coupled with a boronic acid such as **53** in the presence of a catalyst such as

- 30 -

palladium acetate, a base such as sodium carbonate, potassium carbonate, lithium carbonate, cesium carbonate, potassium t-butoxide, sodium t-butoxide, or lithium t-butoxide in a solvent such as toluene, MTBE, DME, or hexane to give **54**.

[0081] Step C: The coupled product **54** is then N-oxidized in the presence of a reagent such as MCPBA, peracetic acid, or MMPP in a chlorinated solvent such as CH₂Cl₂ or 1,2-dichloroethane to give **55**.

[0082] Step D: The activated N-oxide **55** is halogenated in the presence of a reagent such as POCl₃, POBr₃, SOCl₂, SO₂Cl₂, or SOBr₂ to give **41**.

[0083] Steps 1 and 2 are as set forth for Scheme 4 above.

[0084] Step E: The free amine of **44** is derivatized to form the corresponding urea by reaction with an activated carbonyl such as X₄C(O)X₅, wherein X₄ and X₅ each are independently selected from Cl, Br, I, imidazole, O-Ph, p-nitrophenyloxy, substituted O-aryl, or a leaving group, and then reacting the carbonyl with ammonium hydroxide in a solvent such as toluene, DME, or MTBE to form **56**.

[0085] Step F: The ester functionality of **56** is reduced to the corresponding alcohol in the presence of a reducing agent such as DIBAL, LAH, super hydride, L-Selectide, LiBH₄, NaBH₃(anilide), Red-Al, or NaBH₄ in a solvent such as THF, DME, MTBE, MeOH, EtOH, IPA, t-BuOH, glyme, or diglyme to form **57**.

[0086] Step G: The alcohol of **57** may be further functionalized such as by reaction with X₄C(O)X₅, wherein X₄ and X₅ are as described in step E above, then reacting the carbonyl with OH(CH₂)₂NH₂ to form **58**.

- 31 -

[0087] Scheme 6 provides an example using the method of the instant invention to produce a diaryl amine.

Scheme 6

5 [0088] The various steps illustrated in Scheme 6 may be briefly described as follows:

[0089] Step 1: 6-chloro-2-(2,4-difluorophenyl)-nicotinic acid ethyl ester **61** is available by synthesis from 2-chloronicotinic acid (see, e.g., Scheme 7). **61** is coupled with a protected aryl amine such as Boc-2,6-difluoroaniline **42** (see, e.g., Scheme 7) in the presence of an alkali metal salt such as cesium carbonate and a solvent such as NMP; or alternatively

10

- 32 -

in the presence of a catalyst such as palladium acetate, optionally a ligand such as BINAP, and optionally a base such as potassium phosphate in a compatible solvent such as toluene to give the
5 protected coupling product of formula **62**.

[0090] Step 2: The protected coupling product **62** is reacted with an acid such as TFA in a suitable solvent such as methylene chloride to give the compound of formula **63**.

10 **[0091]** More generally, one of skill in the art will recognize that the compound of formula **63** may be produced by the reaction of **61a** with **42a**:

wherein X and Y are as defined above.

15 **[0092]** Scheme 7a illustrates the synthesis of starting material **61** and Scheme 7b illustrates the further derivatization of the deprotected coupling product **63** of Scheme 6.

Scheme 7a

- 34 -

Scheme 7b

[0093] The various steps in Schemes 7a and 7b may be briefly described as follows:

5 [0094] Step A: 6-Chloronicotinic acid **51** is activated by reacting with a chloroformate activating agent such as SOCl_2 , phenylchloroformate, or p-nitrophenyl chloroformate, or a carbodiimide activating agent such as CDI, DCC, or EDC in the presence of HOBT and N-hydroxysuccinimide in a polar aprotic solvent
 10 such as CH_2Cl_2 , 1,2-dichloroethane, DMF, or NMP, and heating. An alcohol such as ethanol is then added to form 6-chloronicotinic acid ethyl ester **71**.

[0095] Step B: Compound **71** is coupled with a boronic acid such as **72** in the presence of a catalyst such as palladium acetate, a base such as sodium carbonate, potassium carbonate, lithium carbonate, cesium carbonate, potassium t-butoxide, sodium t-butoxide, or lithium t-butoxide in a solvent such as toluene, MTBE,
 15 DME, or hexane to give **73**.

[0096] Step C: Coupled product **73** is then N-oxidized in the presence of a reagent such as MCPBA, peracetic

- 35 -

acid, or MMPP in a chlorinated solvent such as CH_2Cl_2 or 1,2-dichloroethane to give **74**.

[0097] Step D: The activated N-oxide **74** is halogenated in the presence of a reagent such as POCl_3 ,
5 POBr_3 , SOCl_2 , SO_2Cl_2 , or SOBr_2 to give **61**.

[0098] Steps 1 and 2 are as set forth for Scheme 6 above.

[0099] Step E: The ester functionality of **63** is saponified in the presence of a base such as NaOH in a
10 solvent such as THF, and then acidified in the presence of an acid such as HCl to form **75**.

[0100] Step F: **75** is then reacted with diphosgene followed by NH_4OH to form the amide-urea compound **76**.

15

- 36 -

Scheme 8

[0101] The various steps in Scheme 8 may be briefly described as follows:

- 5 **[0102]** Step A: 6-chloro-2-(2,4-difluorophenyl)-nicotinic acid ethyl ester **61** is available by synthesis from 2-chloronicotinic acid. Starting material **61** is coupled with a protected aryl amine such as Boc-2,6-difluoroaniline **42** in the presence of an alkali metal salt such as cesium carbonate in a compatible solvent such as NMP to give the protected coupling product.
- 10 The protected coupling product is then reacted with an acid such as TFA in a suitable solvent such as methylene chloride to give the compound of formula **63**.
- 15 **[0103]** Step B: The ester functionality of **63** is saponified in the presence of a base such as NaOH in a solvent such as THF, and then acidified in the presence of an acid such as HCl to form **75**.

- 37 -

[0104] Step C: **75** is then reacted with diphosgene followed by NH_4OH to form the amide-urea compound **76**.

[0105] The following examples illustrate the present invention in a manner in which it may be practiced, but
5 should not be construed as limitations upon the overall scope of the processes of the invention.

[0106] Where applicable, the following HPLC method was utilized unless otherwise indicated: a gradient of water:acetonitrile, 0.1% TFA (90:10 \rightarrow 10:90 \rightarrow 90:10)
10 was run over 26 minutes at 1 mL/min and 254 nm. The method utilizes the Zorbax SB Phenyl 4.6 x 25 cm column, 5 μm . The term " T_{ret} " refers to the retention time, in minutes, associated with the compound.

[0107] According to another embodiment, the methods
15 of of the present invention provides compounds of formula (A) or formula (B):

wherein:

each of X_1 , X_2 , X_3 , and X_4 is independently selected
20 from fluoro or chloro; and
R is H or methyl.

[0108] Compounds of formula (A) and formula (B) are useful as inhibitors of p38. International PCT Publication WO 99/58502 (hereinafter "the '502

- 38 -

publication"), the disclosure whereof is incorporated herein by reference, discloses a genus of compounds that encompasses compounds of formula (A) and formula (B). The methods of the present invention may be readily used to produce compounds of the '502 publication.

[0109] According to a preferred embodiment of formula (A), each of X_1 , X_2 , X_3 , and X_4 is fluoro. According to another preferred embodiment of formula (A), R is H.

[0110] According to a preferred embodiment of formula (B), each of X_1 , X_2 , and X_4 is fluoro. According to another preferred embodiment of formula (B), R is H.

[0111] According to the most preferred embodiment of formula (B), the methods of the present invention produce compound 77 below:

- 39 -

EXAMPLESExample 1**52**

5 **2-Chloro-nicotinic acid methyl ester (52):** **52** was prepared according to the method of Synth. Comm. 26(12), 2257-2272 (1996). To a nitrogen purged flask was charged 2-chloro-nicotinic acid (1000.0 g, 6.0 moles, 1.0 eq) followed by 9L methylene chloride. To
10 this was added thionyl chloride (1.4 L, 19.7 moles, 3.2 eq.) and the reaction was heated to 40°C with vigorous stirring under nitrogen overnight. The acid chloride solution was cooled in an ice bath and methanol (3L, 74 moles, 12 eq.) was slowly added while keeping the
15 temperature at 20°C. The rate limiting parameter is the vigorous evolution of copious quantities of HCl gas. After the addition, HPLC analysis [T_{ret} starting material = 7.5 min, T_{ret} **52** = 11 min] showed the product had formed immediately. The volatiles were removed *in*
20 *vacuo* and the residue extracted from 10% Na₂CO₃ with EtOAc. The combined organics were dried (MgSO₄), filtered, and concentrated to a pale yellow oil.

25

Example 2

- 40 -

**54****2-(4-Fluoro-phenyl)-nicotinic acid methyl ester (54):**

To a nitrogen purged flask was charged Pd(Ph₃)₄ (1.84 g, 1.6 mmol, 0.005 eq), sodium carbonate (42.8 g, 404 mmol, 1.3 eq), **52** (55.5 g, 320.6 mmol, 1.0 eq), p-fluorophenylboronic acid (53.8 g, 384.7 mmol, 1.2 eq), followed by 1.3 L denatured EtOH. The reaction was heated to 78°C with vigorous stirring under N₂ overnight. HPLC analysis [T_{ret} **52** = 10 min, T_{ret} **54** = 12 min] of the reaction mixture showed that the starting material was completely consumed and a later-eluting peak produced. The reaction was cooled to room temperature and the solvents removed under vacuum. The residue was dissolved in EtOAc, washed, dried (MgSO₄), filtered through celite, and concentrated to afford a pale yellow solid **54**.

- 41 -

Example 3**55****2-(4-Fluoro-phenyl)-1-oxy-nicotinic acid methyl ester**

5 **(55):** To a nitrogen purged flask was charged urea
hydrogen peroxide (86.9 g, 924 mmols, 4.0 eq.), the
diaryl pyridine **54** (53.4 g, 231 mmols, 1.0 eq) and
530 mL acetic acid. The bright yellow homogeneous
solution was heated to 70-75°C with vigorous stirring
10 under nitrogen until the HPLC analysis [T_{ret} **54** = 12
min, T_{ret} **55** = 10 min] showed > 97% completion. The
reaction was cooled to room temperature and the
contents slowly poured onto 500 g of ice. To the
vigorously stirred icy mixture was slowly added 6N NaOH
15 to pH 7 while maintaining a temperature of 30°C. EtOAc
and NaHCO₃ (solid) were added until an aqueous pH of 8-
9 was reached, and the solids dissolved. The layers
were separated and the aqueous layer back-extracted
with EtOAc. The combined organics were washed with 5%
20 NaHCO₃ and then tested by peroxide test strips for the
presence of oxidant. If the organic layer was positive
for peracid, the bicarbonate washes were repeated until
the test was negative. Once negative for peracid, the
combined organics were dried (MgSO₄), filtered, and
25 concentrated to a pale yellow solid **55**.

- 42 -

Example 4**41**

6-Chloro-2-(4-fluorophenyl)-nicotinic acid methyl ester (41): To a nitrogen purged flask was charged the N-Oxide **55** (45 g, 182 mmols, 1.0 eq) followed by 300 mL dichloroethane. The phosphorous oxychloride (101 mL, 1080 mmols, 6 eq) was added all at once, causing an immediate rise in temperature from 17 to 19°C followed by gradual warming after that. The solution was heated under nitrogen to 70-75°C until HPLC analysis [T_{ret} **55** = 10 min, T_{ret} **41** = 17 min] showed >94% completion. The reaction was cooled to room temperature and the contents concentrated under vacuum to remove most of the POCl₃. The remainder was quenched by slowly pouring onto 450 g of ice. After melting the ice, the product was extracted into methylene chloride. The combined organics were dried (MgSO₄), filtered through silica, eluted with methylene chloride, and concentrated to a solid **41**.

Example 5**44**

- 43 -

6-(2,6-Difluoro-phenylamino)-2-(4-fluoro-phenyl)-nicotinic acid methyl ester (44): To a nitrogen purged flask was charged palladium acetate (13.2 g, 59 mmol, 0.04 eq), racemic BINAP (36.6 g, 59 mmol, 0.04 eq), followed by 1.9L toluene. The heterogeneous slurry was heated to 50°C under nitrogen for 2 hours, cooled to 30°C, then the pyridyl chloride **41** (386.4 g, 1.45 mol, 1.0 eq) and Boc-2,6-difluoroaniline **42** (386.4 g, 1.69 mol, 1.2 eq), and K₃PO₄ (872 g, 4.1 mol, 2.8 eq) were added all at once followed by a 1.9L toluene rinse. The heterogeneous reaction mixture was heated to 100°C overnight and monitored by HPLC. When the reaction showed complete conversion to **43** by HPLC [*T*_{ret} **41** = 17 min, *T*_{ret} **43** = 20.5 min, *T*_{ret} **44** = 17.6 min, monitored at 229 nm] (usually between 18-20 hours) the reaction was cooled to room temperature and the contents diluted with 1.94 L EtOAc. To this was added 1 x 1.94 L of 6N HCl, and both layers were filtered through celite. The celite wet cake was rinsed with 2 x 1.9 L EtOAc. The layers were separated and the organic layer washed with 1 x 1.9 L of brine, dried (MgSO₄), filtered and concentrated to a brown, viscous oil. To remove the Boc-protecting group, the oil was dissolved in 1.94 L of methylene chloride and 388 mL TFA was added. The reaction was stirred overnight to facilitate Boc removal. The volatiles were removed in vacuo, EtOAc (1.9 L) and sufficient quantity of 1 or 6 N NaOH was added until the pH was 2-7. Then a sufficient quantity of 5% NaHCO₃ was added to bring the pH to 8-9. The organic layer was separated and washed with 1 x 5% NaHCO₃, dried (MgSO₄), filtered and concentrated to a brown oil/liquid. The crude

- 44 -

oil/liquid was azeodried twice with a sufficient quantity of toluene. At times the free base precipitated out resulting in a slurry. The residue was dissolved in 500 mL toluene and 1.6 L 1N HCl/ether solution was added, which resulted in the solids crashing out. Heat was applied until the homogenized/solids broke up. If necessary, 200 mL of EtOAc can be added to facilitate the break up. After cooling, the solid **44** was isolated by vacuum filtration.

Example 6**56**

6-1-(2,6-Difluoro-phenyl)-ureido]-2-(4-fluoro-phenyl)-nicotinic acid methyl ester (56): To a nitrogen purged flask was charged the amino ester HCl salt of **44** (262 g, 0.67 mole, 1.0eq), followed by 1.2 L toluene. To the heterogeneous mixture was added phosgene (1.4 L of 1.93 M toluene solution, 2.7 moles, 4.0 eq) and the reaction was heated to 50°C under nitrogen overnight. The progress of the reaction to form the -NC(O)Cl moiety was monitored by HPLC [T_{ret} **44** = 17.6 min, T_{ret} carbamoyl intermediate = 19.7 min, T_{ret} **56** = 16.4 min, monitored at 229 nm]. Once the nitrogen was completely reacted, the brown solution was cooled to approximately -5°C, and NH_4OH (0.84L, 12.4 moles, 18.5 eq) was slowly added dropwise. As the addition neared completion a solid

- 45 -

formed. The slurry was stirred with 1L of water and collected by vacuum filtration. The wet cake was washed with 1 x 390 mL toluene to remove late eluting impurities.

5

Example 7

57

1-(2,6-Difluoro-phenyl)-1-[6-(4-fluoro-phenyl)-5-hydroxymethyl-pyridin-2-yl]-urea (57): To a nitrogen
10 purged flask was charged the urea-ester **56** (10.0g, 24.92 mmol, 1.0 eq) followed by 10 mL THF. The mixture was cooled to 0-5°C. To the cooled solution was added DIBAL-H/THF solution (149.5 mL, 149.5 mmol, 6.0 eq) dropwise over 20-30 minutes. The mixture was stirred
15 at 15-20°C while the reaction progress was monitored by HPLC [T_{ret} **56** = 16.4 min, T_{ret} **57** = 14.0 min, monitored at 229 nm]. The reaction mixture was quenched into cooled (5-10°C) 15% aqueous H₂SO₄ (150 mL). After the quench was completed, the mixture was stirred for 10-15
20 minutes. To the mixture was added TBME (150 mL). The mixture was heated at 50°C for 60 minutes. The mixture was cooled to ambient temperature, and the aqueous layer was removed. The organic layer was concentrated to about 35 mL of residual volume. The dilution and
25 concentration process was then repeated. The residual mixture was cooled to 0-2°C, and held at that temperature for 45 minutes. The off-white solid **57** was collected by suction filtration using cold toluene (25 mL) as a rinse solvent. The solid was dried under

- 46 -

vacuum at ambient temperature for 3-5 hours to afford 80% corrected yield.

Example 8

58

5
(2-Hydroxy-ethyl)-carbamic acid 6-[1-(2,6-difluoro-phenyl)-ureido]-2-(4-fluorophenyl)-pyridin-3-yl methyl ester (58): To a nitrogen purged flask was charged the benzylic alcohol **57** (7.1g, 19.0 mmoles, 1.0 eq) and
10 CDI (6.2 g, 38.0 mmoles, 2.0 eq) followed by 71 mL THF. The solution was stirred at room temperature for 1-2 hours and then test-quenched into dry acetonitrile/excess ethanolamine. If the activation was not complete, additional CDI can be added until the
15 test quench indicated complete conversion. Once the test-quench showed complete conversion to **58**, the reaction was quenched by slowly adding 2.0 eq ethanolamine (0.64 mL, 38 mmoles). The reaction was stirred at room temperature for 2 hours whereupon HPLC
20 analysis [T_{ret} **57** = 14.2 min, T_{ret} **58** = 13.6 min, monitored at 229 nm] indicated complete conversion to **58**. The THF was removed under vacuum and the residue dissolved in 71 mL ethyl acetate and washed with aqueous NH₄Cl solution (2 x 71 mL) followed by brine (1
25 x 71 mL). The organic layer was azeodried with EtOAc (2 x 71 mL). The residue was reconstituted with 71 mL EtOAc, filtered, and re-concentrated. To the final residue was added 7.1 mL EtOAc and 63 mL of toluene

- 47 -

then gently heated to 35-40°C. Upon cooling, a white solid formed which could be isolated by vacuum filtration and washed with cold toluene.

5

Example 9

2-(2,4-Difluorophenyl)-6-(2,6-difluorophenylamino)-nicotinic acid ethyl ester (63): In a 1 L, 4-necked, round-bottomed flask equipped with an overhead mechanical stirrer, heating mantle, reflux condenser, and thermocouple was charged **61** (50g), Cs₂CO₃ (150g) and 0.15 L of NMP. The solution was stirred vigorously and heated to 65 °C at which time to the suspension was added a solution of **42** (60g) in 0.10 L of NMP over 10 minutes. Heating at 65 °C for 18 hours, HPLC showed ~ 85 % conversion of **61** to the desired Boc adduct. At this time, the temperature was increased to 75 °C, and HPLC analysis after heating for an additional 18 hours showed ~ 97 % conversion of **61** to the desired Boc adduct **62** (not shown). The mixture was then cooled to 20 and poured in one portion into 2.0 L of water stirring in a 4-necked, 3 L, round-bottomed flask equipped with an overhead mechanical stirrer and thermocouple. The temperature of the water rose from 22 °C to 27 °C as a result of the addition of the NMP solution. The suspension was then cooled to 15 °C and

- 48 -

the tan solid was collected by filtration, rinsed with water and pulled dry on the filter for 2 hours.

In a 2 L, 4-necked, round-bottomed flask equipped
5 with an overhead mechanical stirrer and thermocouple
was charged the tan solid and 0.8 L of
CH₂Cl₂. To the stirred solution was added 70 mL of TFA
in one portion. After two hours stirring at ambient
temperature, none of the Boc protected material was
10 detected by HPLC, and the mixture was concentrated by
rotary evaporation. The oily residue was taken up in
0.7 L EtOAc, and treated with 0.7 L saturated NaHCO₃,
during which gas was produced. The EtOAc layer was
washed with 0.25 L saturated NaCl and concentrated by
15 rotary evaporation. To the resultant brown oil was
added 0.2 L EtOAc and the solution treated with HCl in
Et₂O (0.4 L of 2.0 M solution) and stirred for 60
minutes. The product **63**, a yellow powder, was
collected by filtration (70.5% yield).

20 The product may be recrystallized by heating the
crude salt in 4 mL EtOH/g of crude product to reflux,
then cooling to ambient temperature.

While we have hereinbefore presented a number of
25 embodiments of this invention, it is apparent that the
basic construction can be altered to provide other
embodiments which utilize the methods of this
invention. Therefore, it will be appreciated that the
scope of this invention is to be defined by the claims
30 appended hereto rather than the specific embodiments
which have been presented hereinbefore by way of
example.

- 49 -

CLAIMS

What is claimed is:

1. A process for producing a diaryl amine compound of the formula (I):

(I)

or a salt thereof,

said process comprising the step of coupling a compound of formula (II) with an amine of formula (III) in the presence of an alkali metal salt or a transition metal catalyst:

(II)

(III)

wherein:

Ar₁ and Ar₂ are independently Q;

wherein each Q is an aryl or heteroaryl ring system optionally fused to a saturated or unsaturated 5-8 membered ring having 0-4 heteroatoms;

wherein Q is optionally substituted at one or more ring atoms with one or more substituents independently selected from halo; C₁-C₆ aliphatic optionally substituted with N(R')₂, OR', CO₂R', C(O)N(R')₂, OC(O)N(R')₂, NR'CO₂R', NR'C(O)R', SO₂N(R')₂, N=CH-N(R')₂, or OPO₃H₂; C₁-C₆ alkoxy optionally substituted with N(R')₂, OR', CO₂R', C(O)N(R')₂, OC(O)N(R')₂, NR'CO₂R', NR'C(O)R', SO₂N(R')₂, N=CH-N(R')₂, or OPO₃H₂; Ar₃; CF₃; OCF₃; OR'; SR'; SO₂N(R')₂; OSO₂R'; SCF₃; NO₂; CN; N(R')₂; CO₂R'; CO₂N(R')₂; C(O)N(R')₂; NR'C(O)R'; NR'CO₂R'; NR'C(O)C(O)R'; NR'SO₂R'; OC(O)R'; NR'C(O)R²; NR'CO₂R²; NR'C(O)C(O)R²; NR'C(O)N(R')₂;

- 50 -

OC(O)N(R')_2 ; $\text{NR'SO}_2\text{R}^2$; NR'R^2 ; $\text{N(R}^2)_2$; OC(O)R^2 ; OPO_3H_2 ; and N=CH-N(R')_2 ;

R' is selected from hydrogen; C_1 - C_6 aliphatic; or a 5-6 membered carbocyclic or heterocyclic ring system optionally substituted with 1 to 3 substituents independently selected from halo, C_1 - C_6 alkoxy, cyano, nitro, amino, hydroxy, and C_1 - C_6 aliphatic;

R^2 is a C_1 - C_6 aliphatic optionally substituted with N(R')_2 , OR' , $\text{CO}_2\text{R}'$, C(O)N(R')_2 or $\text{SO}_2\text{N(R')}_2$; or a carbocyclic or heterocyclic ring system optionally substituted with N(R')_2 , OR' , $\text{CO}_2\text{R}'$, C(O)N(R')_2 or $\text{SO}_2\text{N(R')}_2$;

wherein Ar_3 is an aryl or heteroaryl ring system optionally fused to a saturated or unsaturated 5-8 membered ring having 0-4 heteroatoms;

wherein Ar_3 is optionally substituted at one or more ring atoms with one or more substituents independently selected from halo; C_1 - C_6 aliphatic optionally substituted with N(R')_2 , OR' , $\text{CO}_2\text{R}'$, C(O)N(R')_2 , OC(O)N(R')_2 , $\text{NR'CO}_2\text{R}'$, $\text{NR'C(O)R}'$, $\text{SO}_2\text{N(R')}_2$, N=C-N(R')_2 , or OPO_3H_2 ; C_1 - C_6 alkoxy optionally substituted with N(R')_2 , OR' , $\text{CO}_2\text{R}'$, C(O)N(R')_2 , OC(O)N(R')_2 , $\text{SO}_2\text{N(R')}_2$, $\text{NR'CO}_2\text{R}'$, $\text{NR'C(O)R}'$, N=C-N(R')_2 , or OPO_3H_2 ; CF_3 ; OCF_3 ; OR' ; SR' ; $\text{SO}_2\text{N(R')}_2$; $\text{OSO}_2\text{R}'$; SCF_3 ; NO_2 ; CN ; N(R')_2 ; $\text{CO}_2\text{R}'$; $\text{CO}_2\text{N(R')}_2$; C(O)N(R')_2 ; $\text{NR'C(O)R}'$; $\text{NR'CO}_2\text{R}'$; $\text{NR'C(O)C(O)R}'$; $\text{NR'SO}_2\text{R}'$; $\text{OC(O)R}'$; NR'C(O)R^2 ; $\text{NR'CO}_2\text{R}^2$; NR'C(O)C(O)R^2 ; NR'C(O)N(R')_2 ; OC(O)N(R')_2 ; $\text{NR'SO}_2\text{R}^2$; NR'R^2 ; $\text{N(R}^2)_2$; OC(O)R^2 ; OPO_3H_2 ; and $-\text{N=C-N(R')}_2$;

X is a leaving group;

Y is $-\text{C(O)-O-Z}$; and

- 51 -

Z is C₁-C₆ aliphatic, benzyl, Fmoc, -SO₂R' or Q, provided that Q is not substituted with X or alkyne.

2. The process according to claim 1, further comprising the step of removing group Y from the coupled amine to produce the compound of formula (I).

3. The process according to claim 1, wherein the process is performed using a transition metal catalyst.

4. The process according to claim 3, wherein the transition metal catalyst comprises palladium.

5. The process according to claim 4 wherein the catalyst is PdL_n, wherein

each L is independently selected from -OAc, -O-tolyl, halogen, PPh₃, dppe, dppf, dba, and BINAP; and n is an integer from 0-4.

6. The process according to claim 3, wherein the step of coupling a compound of formula (II) with an amine of formula (III) is performed in the presence of a base.

7. The process according to claim 6, wherein the base is selected from KOtBu, NaOtBu, K₃PO₄, Na₂CO₃, and Cs₂CO₃.

8. The process according to claim 1, wherein the process is performed using an alkali metal salt.

9. The process according to claim 8, wherein the alkali metal salt is selected from salts of potassium, rubidium, or cesium ions.

- 52 -

10. The process according to claim 9, wherein the alkali metal salt is selected from potassium carbonate or cesium carbonate.

11. The process according to claim 10, wherein the alkali metal salt is cesium carbonate.

12. The process according to claim 1, wherein X is selected from the group consisting of -Cl, -Br, -I, -F, -OTf, -OTs, iodonium, and diazo.

13. The process according to claim 1, wherein Y is Boc.

14. The process according to claim 1 for producing a diaryl amine compound of the formula:

comprising the step of coupling a compound of formula **21** with an amine of formula **22** in the presence of an alkali metal salt or a transition metal catalyst:

wherein:

R^3 is selected from aliphatic, aryl, or aryl substituted with aliphatic, aryl, nitro, CN, CO_2R' , $CO_2N(R')_2$, OR' , NCO_2R' , $NR'C(O)N(R')_2$, and $OC(O)N(R')_2$;

- 53 -

provided that R^3 is not t-butyl; and

G_1 , G_2 , G_3 , G_4 , and G_5 are independently selected from hydrogen, aliphatic, aryl, substituted aryl, nitro, CN, OR', CO_2R' , $CO_2N(R')_2$, $NR'CO_2R'$, $NR'C(O)N(R')_2$, $OC(O)N(R')_2$, F, Cl, Br, I, O-Tos, O-Ms, OSO_2R' , and $OC(O)R'$; and

X and Y are as defined in claim 1.

15. The process according to claim 14 further comprising the step of removing group Y from the coupled amine to produce the compound of formula **24**.

16. The process according to claim 14, wherein the process is performed using a transition metal catalyst.

17. The process according to claim 16, wherein the transition metal catalyst comprises palladium.

18. The process according to claim 17 wherein the catalyst is PdL_n , wherein

each L independently is selected from -OAc, -O-tolyl, halogen, PPh_3 , dppe, dppf, dba, and BINAP; and n is an integer from 0-4.

19. The process according to claim 16, wherein the step of coupling a compound of formula **21** with an amine of formula **22** is performed in the presence of a base.

20. The process according to claim 19, wherein the base is selected from KOtBu, NaOtBu, K_3PO_4 , Na_2CO_3 , and CS_2CO_3 .

21. The process according to claim 14, wherein the process is performed using an alkali metal salt.

- 54 -

22. The process according to claim 21, wherein the alkali metal salt is selected from salts of potassium, rubidium, or cesium ions.

23. The process according to claim 22, wherein the alkali metal salt is selected from potassium carbonate or cesium carbonate.

24. The process according to claim 23, wherein the alkali metal salt is cesium carbonate.

25. The process according to claim 14, wherein X is selected from the group consisting of -Cl, -Br, -I, -F, -OTf, -OTs, iodonium, and diazo.

26. The process according to claim 14, wherein Y is Boc.

27. The process according to claim 1 for producing a diaryl amine compound of the formula:

or a salt thereof,

5 said process comprising the step of coupling a compound of formula **41a** with an amine of formula **42a** in the presence of an alkali metal salt or a transition metal catalyst:

- 55 -

wherein X and Y are as defined in claim 1 above.

28. The process according to claim 27, further comprising the step of removing group Y from the coupled amine to produce the compound of formula **44**.

29. The process according to claim 27, wherein the process is performed using a transition metal catalyst.

30. The process according to claim 29, wherein the transition metal catalyst comprises palladium.

31. The process according to claim 30 wherein the catalyst is PdL_n, wherein

each L is independently selected from -OAc, -O-tolyl, halogen, PPh₃, dppe, dppf, dba, and BINAP; and n is an integer from 0-4.

32. The process according to claim 29, wherein the step of coupling a compound of formula **41a** with an amine of formula **42a** is performed in the presence of a base.

33. The process according to claim 32, wherein the base is selected from KOtBu, NaOtBu, K₃PO₄, Na₂CO₃, and Cs₂CO₃.

34. The process according to claim 27, wherein the process is performed using an alkali metal salt.

- 56 -

35. The process according to claim 34, wherein the alkali metal salt is selected from salts of potassium, rubidium, or cesium ions.

36. The process according to claim 35, wherein the alkali metal salt is selected from potassium carbonate or cesium carbonate.

37. The process according to claim 36, wherein the alkali metal salt is cesium carbonate.

38. The process according to claim 27, wherein X is selected from the group consisting of -Cl, -Br, -I, -F, -OTf, -OTs, iodonium, and diazo.

39. The process according to claim 27, wherein Y is Boc.

40. The process according to claim 1 for producing a diaryl amine compound of the formula:

63

or a salt thereof,
said process comprising the step of coupling a compound of formula **61a** with an amine of formula **42a** in the presence of an alkali metal salt or a transition metal catalyst:

**61a****42a**

wherein X and Y are as defined in claim 1 above.

41. The process according to claim 40, further comprising the step of removing group Y from the coupled amine to produce the compound of formula **63**.

42. The process according to claim 40, wherein the process is performed using a transition metal catalyst.

43. The process according to claim 42, wherein the transition metal catalyst comprises palladium.

44. The process according to claim 43, wherein the catalyst is PdL_n, wherein

each L is independently selected from -OAc, -O-tolyl, halogen, PPh₃, dppe, dppf, dba, and BINAP; and n is an integer from 0-4.

45. The process according to claim 42, wherein the step of coupling a compound of formula **61a** with an amine of formula **42a** is performed in the presence of a base.

46. The process according to claim 45, wherein the base is selected from KOtBu, NaOtBu, K₃PO₄, Na₂CO₃, and Cs₂CO₃.

47. The process according to claim 40, wherein the process is performed using an alkali metal salt.

48. The process according to claim 47, wherein the alkali metal salt is selected from salts of potassium, rubidium, or cesium ions.

49. The process according to claim 48, wherein the alkali metal salt is selected from potassium carbonate or cesium carbonate.

50. The process according to claim 49, wherein the alkali metal salt is cesium carbonate.

51. The process according to claim 40, wherein X is selected from the group consisting of -Cl, -Br, -I, -F, -OTf, -OTs, iodonium, and diazo.

52. The process according to claim 40, wherein Y is Boc.

53. The process according to claim 40 for producing a diaryl amine compound of the formula:

or a salt thereof,

said process comprising the step of coupling a compound of formula 61 with an amine of formula 42 in the presence of a suitable alkali metal salt or transition metal catalyst:

- 59 -

54. The process according to claim 53 further comprising the step of removing the Boc group from the coupled amine to produce the compound of formula **63**.

55. The process according to any of claims 53 or 54 wherein the process is performed using cesium carbonate.

56. The process according to claim 54 further comprising the steps of:

(a) reacting the compound of formula **63** with a base; and

5 (b) acidifying the reaction mixture formed in step (a) to produce a compound of the formula **75**:

**75**

57. The process according to claim 56 wherein the base in step (a) is NaOH.

58. The process according to claim 56 wherein the acid in step (b) is HCl.

59. The process according to claim 56 further comprising the steps of:

(c) reacting the compound of formula **75** with diphosgene; and

5 (d) treating the reaction mixture formed in step (c) with NH_4OH to produce a compound of the formula **76**:
